

The ETbb package—Edward Tufte’s version of Bembo

Michael Sharpe

Background

The fonts in this package were derived ultimately from the collection of fonts commissioned by Edward Tufte for his own books, and released in 2015 as ET-Bembo under the MIT license. (The sources for that collection were fonts using the family name ET-book.) That collection was enhanced in 2019 under the name XETBook by Daniel Benjamin Miller, and it is his package which was the starting point for ETbb, where the bb denotes the Berry abbreviation for Bembo. The final section of this document makes a detailed comparison with the earlier fbb package, which is also Bembo-like, derived from Cardo. The most significant differences are that ETbb has a regular upright that is about 20% darker than the corresponding fbb, and its ascender height is noticeably less. These differences make ETbb have a less spindly appearance that is closer in spirit to the print produced by traditional metal versions of Bembo.

Package properties

The package makes a number of changes to the XETBook fonts:

- The released version of ET-Bembo lacks kerning tables—a serious omission—rectified in ETbb.
- The scale has been increased by 3.36% so that the x-height of the upright regular face is 431, very close to Computer Modern and Libertine.
- The lining figures in some faces were reduced so as to be a bit less than the cap-heights.
- The lining figures in XETBook were proportional rather than tabular. I’ve added new tabular lining and old-style figures.
- Added superior letters and figures to all faces. E.g., `\textsu{ABCabc123}` renders as ^{ABCabc123}.
- Added inferior figures to all faces with baseline at -112em.
- Added denominator figures to all faces with baseline at 0em.
- The originals comprised glyphs in the Adobe Standard Encoding, forming a rather sparse subset of the T1 encoding. I’ve added accented and composite glyphs that provide complete coverage of the T1 encoding as well as many glyphs required in the orthography of a number Eastern European countries.
- Prior to version 1.02, coverage of TS1 encoding was meager. The coverage is now close to full. (See the table at the end of this document.)
- Small caps have been added to all faces.

- There is a new glyph for the German capital sharp S (\mathfrak{B} , *großes eszett*, U+1E9E), approved in 2017 for optional use in German orthography. Small cap versions are also provided.
- The glyph capital P has been changed from its default closed shape, as used in almost all modern digital renderings of Bembo, to the more historically accurate open shape. See, for example, the reproduction of Pietro Bembo's *De Aetna* at <https://ia601405.us.archive.org/34/items/ita-bnc-ald-00000673-001/ita-bnc-ald-00000673-001.pdf>. (A higher resolution rendering of a two-page sample is available from https://upload.wikimedia.org/wikipedia/commons/8/89/De_Aetna_1495.jpg.)

Package options and macros

This package has most of the same features and options as the `fbf` package and even includes the `altP` option, though that has no effect because the alternate P shapes in `fbf` are the default in `ETbb`.

In the original `XETBook`, the dollar and cent currency symbols were `oldstyle`. I've added the new style symbols and made them the default, but option `osdollar` to `ETbb` changes back to the `oldstyle` symbols.

New in version 1.05: A swash version of Q has been added to all faces. You may enable it globally using option `swashQ` to `ETbb`, or specify it locally with the macro `\Qswash`, which renders as $\overset{\curvearrowright}{Q}$. If you had enabled it globally, you have access to the ordinary Q with the macro `\Qnoswash`.

Text figures may be selected from four types:

- Proportional lining (LF), selected by options `lining`, `proportional` [or `p`]; (`lining`, or `lf`, is the default figure style;)
- Tabular lining (TLF), selected by options `lining` [or `lf`], `tabular` [or `t`]; (`tabular` is the default figure alignment;)
- Proportional oldstyle (OsF), selected by option `oldstyle` [or `osf`], `proportional` [or `p`];
- Tabular oldstyle (TOsF), selected by options `oldstyle` [or `osf`], `tabular` [or `t`].

The package also defines macros that allow you use alternate figure styles locally:

Macro	result	comment
<code>\textlf{0123456789}</code>	0123456789	print 0123456789 in proportional lining figures
<code>\texttlf{0123456789}</code>	0123456789	print 0123456789 in tabular lining figures
<code>\textosf{0123456789}</code>	0123456789	print 0123456789 in proportional oldstyle figures
<code>\texttosf{0123456789}</code>	0123456789	print 0123456789 in tabular oldstyle figures
<code>\textsu{0123456789}</code>	$\overset{0123456789}{}$	print 0123456789 in superior figures
<code>\textin{0123456789}</code>	$\underset{0123456789}{}$	print 0123456789 in inferior figures
<code>\textde{0123456789}</code>	$\frac{0123456789}{}$	print 0123456789 in denominator figures

The macro `\textlf{123}` is identical in effect to `\lfstyle 123`, and similarly for the other lining and oldstyle macros, while `\textsu{123}` has the same effect as `\sufigures 123` and `\textin{123}` has the same effect as `\infigures 123`. If you prefer typing longer names, you may use `\textinferior` as a synonym for `\textin`, and similarly for `\textsu`. Likewise, `\textde{123}` has the same effect as

`{\defigures 123}` or `{\denomfigures 123}`, and you may use `\textdenom` as a synonym for `\textde`. Note the difference in baseline between `\textin` and `\textde`: $_{123}$ versus $_{123}$.

The `\textfrac` macro constructs fractions using `\textsu` and `\textde` with baseline aligned with the text baseline. The behavior is somewhat configurable, there being two parameters available to control the kerns before and after the fraction solidus. The two parameters are passed as options to `ETbb`, named

```
foresolidus % default value -.04em
aftsolidus  % default value -.04em
```

(The values should always be em units in order to behave correctly with respect to scaling.)

EXAMPLE:

- `\textfrac[2]{17}{32}` renders as $2^{17/32}$ with default settings. (The optional argument 2 will always print in lining figures, not matter the choice of the text figure style.)

Option `sup` changes the form of footnote markers to use `ETbb`'s superior figures, unless you have re-defined the meaning of `\thefootnote` prior to loading `ETbb`. For more control over size, spacing and position of footnote markers, use the `superiors` package: E.g.,

```
\usepackage[supstfm=ETbb-Regular-sup-t1]{superiors}
```

Option `sharpS` replaces `SS` in the `T1` encoding by the new `U+1E9E` glyph and replaces the small cap `ss` by the small cap version of `U+1E9E`. Only figure-styles `TLF`, `LF`, `OsF` and `T0sF` are handled, and only in the `T1` encoding.

Option `scosf` forces the use of `OsF` figures in a small caps block, no matter what the default figure settings.

There is a `scaled` [or `scale`] option (e.g., `scaled=.97`) that allow you to adjust the text size against, say, a math package.

A suggested math companion

This text package works well with `newtxmath` with the `libertine` option, because the latter has italics of the same italic angle as `ETbb` and of very similar `xheight` and `weight`. If you have the `MinionPro` fonts (version 2.0 or higher) and have set them up with `FontPro` and the `minion2newtx` CTAN package, then the `minion` option to `newtxmath` provides a very good math companion with better Greek letters than `libertine`. The suggested invocation for `libertine` math is:

```
% load babel package and options here
\usepackage[p,osf]{ETbb} % osf in text, tabular lining figures in math
\usepackage[scaled=.95,type1]{cabin} % sans serif in style of Gill Sans
\usepackage[varqu,varl]{zi4} % inconsolata typewriter
\usepackage[T1]{fontenc} % LY1 also works
\usepackage[libertine,vvarbb]{newtxmath}
%\usepackage[cal=boondoxo,bb=boondox,frak=boondox]{mathalfa}
```

Here is a short sample based on this preamble:

The typeset math below follows the ISO recommendations that only variables be set in italic. Note the

use of upright shapes for d , e and π . (The first two are entered as `\mathrm{d}` and `\mathrm{e}`, and in fonts derived from `newtxmath` or `mtpro2`, the latter is entered as `\uppi`.)

Simplest form of the Central Limit Theorem: Let X_1, X_2, \dots be a sequence of iid random variables with mean 0 and variance 1 on a probability space $(\Omega, \mathcal{F}, \mathbb{P})$. Then

$$\mathbb{P}\left(\frac{X_1 + \dots + X_n}{\sqrt{n}} \leq y\right) \rightarrow \mathfrak{N}(y) := \int_{-\infty}^y \frac{e^{-t^2/2}}{\sqrt{2\pi}} dt \quad \text{as } n \rightarrow \infty,$$

or, equivalently, letting $S_n := \sum_1^n X_k$,

$$\mathbb{E}f(S_n/\sqrt{n}) \rightarrow \int_{-\infty}^{\infty} f(t) \frac{e^{-t^2/2}}{\sqrt{2\pi}} dt \quad \text{as } n \rightarrow \infty, \text{ for every } f \in \text{bC}(\mathbb{R}).$$

Glyphs in TS1 encoding

The layout of the TS1 encoded Text Companion font, which is rendered *in regular style only*, is as follows.

	'0	'1	'2	'3	'4	'5	'6	'7

There is a macro `\textcircled` that may be used to construct a circled version of a single letter using `\textbigcircle`. The letter is always constructed from the small cap version, so, in effect, you can only construct circled uppercase letters: `\textcircled{M}` and `\textcircled{m}` have the same effect, namely .

Usage with fontspec

Because the package supplies a file named `ETbb.fontspec` whose contents list the `otf` files that correspond to each of Regular, Bold, Italic and BoldItalic, you may load `ETbb` with just

```

\usepackage{fontspec}
\setmainfont{ETbb}

```

Other than the usual choices of figure style, the only remaining choice available is through `StylisticSet=2`,

which substitutes the new Sharp S glyphs in place of the familiar β , SS and ss. See the table in the next section for details.

Selection of the new Sharp S in LaTeX

The following table summarizes the behavior of the text macros `\SS`, `\ss` and the macro `\MakeUppercase`.

sharpS option	<code>\ss</code>	<code>\SS</code>	<code>\MakeUppercase{\ss}</code>	<code>\textsc{\ss}</code>
Not set	β	SS	SS	ss
sharpS	β	β	β	β

In unicode TeX, the behavior laid out in the table above is achieved using `StylisticSet=2`.

Detailed comparison with fbb

The following picture, in which the units are approximately in bp, shows some of the differences between ETbb-Regular and fbb-Regular, the first scaled up by 10 and the second by 9.8 so that their x-heights (and Cap-heights) are the same. From the picture below you can note the following.

- The serifs are much more substantial in ETbb.
- The ascenders are considerably higher in fbb—in fact, by 50 em units. Those very tall ascenders make for poor positioning of quotes, superscripts and the like.
- Stems are a little thicker (by about 10%) in ETbb.
- There is a slight bowing out in the letter h and similar letters like n of ETbb that is not present in fbb, making for more visual interest, IMO. This would not be of any importance at small print sizes.
- Overall, ETbb has lower contrast (ratio of thickest to thinnest strokes) than fbb, making for a more uniform gray appearance on the printed page.

The following page presents a comparison of a ETbb and fbb with identical text rendered in two columns. For me, there is no question that ETbb is the preferable font for document text.

ETbb on left, fbb on right, normalized to same x-height
